

CCKeyboard

Description is valid for software version [2.10.179.99](#) and newer.

The **CCKeyboard** client application provides a subtitle input interface and, coupled with the [Playout](#) module, can be used for real-time captioning tasks during live broadcasts.

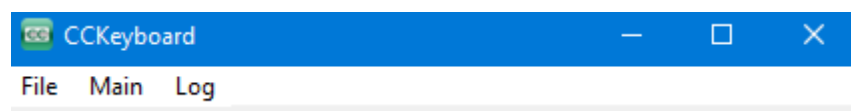

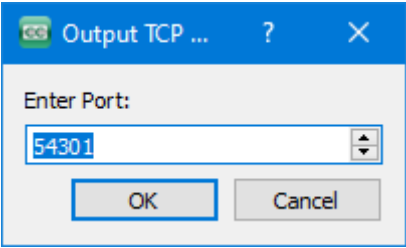

Workflow

The CCKeyboard client application activates a TCP server on a specified port. Then the Playout module makes a connection to this server. Once the connection is successfully established, the entered text will be transmitted to the connected Playout module which outputs the text to the corresponding subtitle service according to its settings.

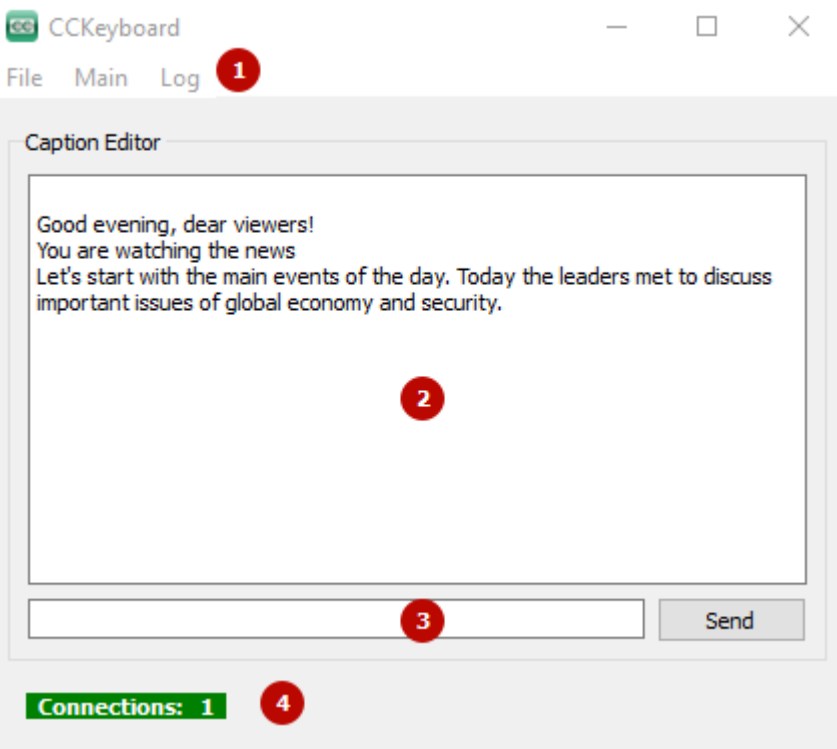

Interface

Menu

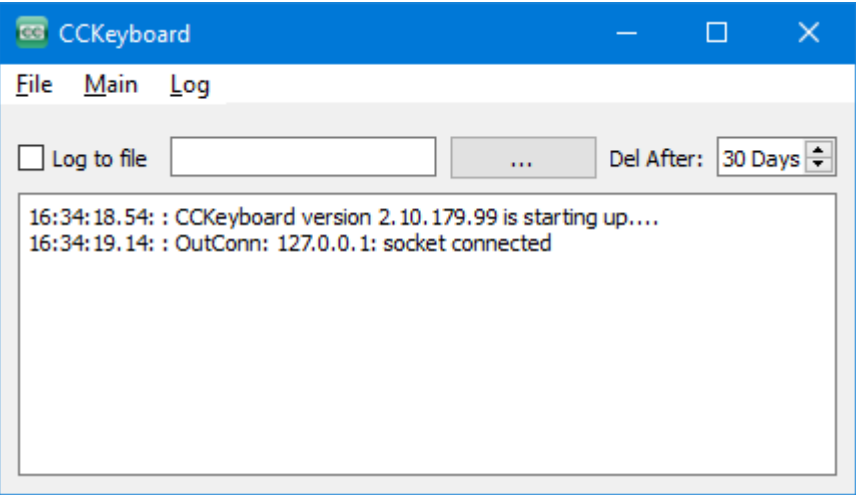

Menu	Description	
File→Configure	Opens a window to configure the TCP port that will be used to start the built-in server. <div></div>	
File→About	Opens an information window about the application.
